c) A combustion reactor is fed with 50 kg mole of butane per hour and 2100 kg mole of air per hour. Calculate the percent excess air
4. Methane is burnt with stoichiometric proportion of air. The reaction is not complete. All the methane that burns is converted to carbon dioxide. If methane and air enter the combustor at 300 K and the total products including unburned methane and unused oxygen leave at 680 K , what percentage of methane is burnt ? The water thus formed leaves the reactor in vapor state.
